Yes our project needs a manager.

While the participants cannot trust each other even without a manager, it seems impossible to exclude him when even the manager is unreliable. Let's assume that there is no manager and we have given manager authority to participants. In case of disagreement, the participant with the authority of the manager causes the others to worry

Although it means moving away from decentralization on the basis of blockchain, there is no complete solution in today's world. If it were, bc companies today would not have grown so large in the pool.
